Suzuki,Y., Yoshitomo-Nakagawa,K., Maruyama,K., Suyama,A. and Sugano,S. Construction and characterization of a full length-enriched and a 5'-end-enriched cDNA library. Gene 200 (1-2), 149-156 (1997).

Location/Qualifiers
10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMM42 (gil4732114(gb)AF129072.1), a copy-number inducible derivative of plasmid Rl. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampliallin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Suzuki,Y., Tsunoda,T., Taira,H., Mizushima-Sugano,J., Sese,J., Hata,H., Ota,T., Isogai,T., Tanaka,T., Nakamura,Y., Morishita,S., Okubo,K., Suyama,A. and Sugano,S.
Fine Structural analysis of transcription start sites of human mRNAs using full-length enriched and 5'-end enriched cDNA libraries Unpublished (2001)

The invention provides a gene for the treatment of muscular dystrophy having at least one rod repeat structure of hinge 1, hinge 4 and rod domain of dystrophin gene and having a base sequence of 4.5 kb. The gene and a gene-introducing medium consisting of an adeno-associated virus (AAV) vector or lentivirus vector containing the rod shortened dystrophin genes can be used for the genetic treatment of muscular dystrophy of low immune reaction. Sequences AAZ48572-584 represent

Cenomic sequences AAT04954-55 of mouse Kv1.7 voltage-gated potassium channel (see AAT04953) show the splice donor and acceptor sites which form the boundaries of the single intervening sequence (see Fig 1A). These sequences are compared with that of mouse (mKv1.7 and hamster (haKv1.7) cDNAs. The potassium channel may be used in drug screening for identification of therapeutics which modulate the channel and, therefore, modulate insulin secretion. Selective antagonists increase insulin release and thereby reduce hyperglycemia associated with non-insulin-dependent diabetes
                                                                                                                                                                                                                                                                                                                                                                    New voltage-gated potassium channel gene - used to identify material(s) which can increase insulin release e.g. for treating non-insulin dependent diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fas ligand; transplant rejection; autoimmune disease; diabetes; inflammation; graft rejection; rheumatoid arthritis; allergy; cystic fibrosis; multiple sclerosis; polymerase chain reaction;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         represent novel Neisseria menigitis and N. gonorrheae polynucleotides and polypeptides. AAZ5457 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                      Masignani V, Mora M;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a packaging vector (PV) comprising a nucleotide sequence encoding Gag and Pol proteins of a reference lentivius that differes from the reference lentivius at least in that:

(a) its major splice donor site is either deleted or is sufficiently different from the reference lentivirus so that it is not a potential site for homologous recombination; and (b) it lacks a functional major packaging signal so that the introduced vector causes the host cell to produce packaging vector particles comprising functional Gag and Pol proteins. The vectors are useful for transforming (eukaryotic) cells to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             packaging vector comprising a nucleotide sequence encoding Gag and proteins of a reference lentivirus useful for the delivery of

ö
express specific genes at high levels, e.g. for gene therapy. The improved vectors are safer, yet permit increased efficiency of packaging the recombinant viral genome and increased long-term gene expression. These properties are required for gene therapy as a means of treating infectious and non-infectious diseases. Unlike other retroviruses, the lentiviruses are able to infect non-dividing cells. The present sequence represents an HIV VPR C-terminal and Tat N-terminal PCR primer which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a gene amplification system comprising a transducing vector, a packaging vector and a suitable host. The lentiviral vectors are useful to transform suitable host cells to express a target gene at high levels in the cells. For example, the vector system can be used therapeutically with both dividing and non-dividing human cells (e.g. neuronal cells and haematopoietic stem cells) e.g. in gene therapy. The vector system is also useful to produce polypeptides in cells (e.g. TB671 and HeLa cells) in vitro and in vivo, and to produce transgenic animals e.g. animals expressing in vivo, and to produce transgenic animals e.g. animals expressing risk of generating replication-competent virus through recombination with the transducing vector or a defective provirus endogenous to the work of the property of the produce the produce provirus endogenous to the work of the produce the produce of the produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 vector system provides increased long-term gene expression compared with other viral vectors (e.g. could remain transduced for at least 120 days), so it may be possible for the vector to remain transduced for the necessary time course of a particular treatment. AAZ5638 to AAZ54578 represent nucleotide sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New gene amplification system, useful to express a target gene in cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR primers AAZ01426-206209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye
                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   diseases such as conventional trachom, nonendemic trachom, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and veneraal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.

The invention relates to a multivalent vaccine for protecting cats against several pathogens, especially pathogens associated with respiratory and digestive diseases. The pathogens are especially selected from feline leukaemia virus (FeLV), feline panleukopaenia virus (FPV), feline calcivirus (FCV), feline immunodeficiency virus (FIV), or rabies virus. The vaccines are preferably composed of polynucleotide sequences encoding 3 antigens, all as part of vectors. Primers AAV49285-V49286 were used to PCR amplify the feline immunodeficiency virus (FIV) petaluma strain gene encoding the envelope glycoprotein. The sequence sub-cloned into the plasmid pVR1012 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Dillon PJ,
                                                                                                                                                                                                                                                                                         Synthetic.
Turkat cell line CDNA library. The CDNA sequence of Arginase I was used as a probe sequence for a computer search of CDNA databases. Several expressed sequence for a computer search of CDNA databases. Several expressed sequence for a computer sequence homology were identified. These were combined to give a 1075 bp sequence. The above PCR primers were designed to the extreme 3' and 5' ends of the consensus sequence, and used to isolate arginase II. In addition to a hypothetical role in the production of proline and glutamate, it is postulated that arginase II may play an important role in nitric oxide biosynthesis through the production of confithine as a precursor of glutamate. Arginase II, or its agonists, and fragments, are used to treat conditions associated with lack of arginase activity. Compounds that inhibit activation of the protein are used to treat conditions that can be treated are diseases of the protein are used to creat conditions sasociated with excess arginase activity. Typical conditions that can be treated are diseases of the urea cycle, hypertension, hypothension sportated and related spaticity, prostate disease (e.g. cancer, hyperarginaemia and related spaticity, prostate or kidney damage, also nitric oxide associated immune and nervous system diseases. The arginase II cDNA is used to produce recombinant protein and for chromosome in the related are used to produce recombinant protein and for chromosome in the state of arginase in the state of produce recombinant protein and for chromosome arginate arginase in the state of arginase in the state of produce recombinant protein and for chromosome arginate arginase in the state of arginate are used (as primers and probes) to addition, while its fragments are used (as primers and probes) to a determine and nervous system diseases.
                                                                                Arginase II; proline production; glutamate production; hyperarginaemia; nitric oxide biosynthesis; arginase activity; urea cycle disease; hypertension; hypotension; hyperammonaemia; prostate disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           identification, while its fragments are used (as primers and probes) to detect arginase II-encoding sequences and to diagnose the above

The arginase II CDNA is used to produce recombinant protein and for chromosome identification, while its fragments are used (as primers and probes) to detect arginase II-encoding sequences and to diagnose the above
                                                                                                                                                                                                                                                                                                                                           through the production of ornithine as a precursor of glutamate.
Arginase II, or its agonists, antagonists and fragments, are used to treat conditions associated with lack of arginase activity. Compounds that inhibit activation of the protein are used to treat conditions associated with excess arginase activity. Typical conditions that can be
PCR primers AAV00578-90 were used to amplify human arginase II from a Jurkat cell line cDNA library. The cDNA sequence of Arginase I was used as a probe sequence for a computer search of cDNA databases. Several expressed sequence tags with 50-60% sequence homology were identified. These were combined to give a 1075 bp sequence. The above PCR primers were designed to the extreme 3' and 5' ends of the consensus sequence, and used to isolate arginase II. In addition to a hypothetical role in the production of proline and glutamate, it is postulated that arginase II may play an important role in nitric oxide biosynthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

```
The invention relates to a polypeptide with Arginase II activity. The Arginase II polypeptides may be used in gene therapy for the treatment of type I arginase disorders resulting in hyperargininemia. The polypeptide sequences may also be used as immunogens to produce antibodies, these antibodies may then be used to treat numerous diseases e.g. urea disorders, hypertension, hypotension, prostate cancer, benign prostatic hyperplasia. Sequences AAXY7307-319 represent PCR primers used for cloning the Arginase II cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           uropathic; cytostatic; neuroprotective; gene therapy; hypertension; nitric oxide biosynthesis modulator; urea cycle disease; hypotension; episodic hyperammonaemia; hyperargininaemia; spasticity; prostatitis; growth retardation; progressive mental impairment; prostate disease; prostate cancer; benign prostatic hyperplasia; hypertrophy; prostate damage; kidney disease; kidney damage; PCR primer; ss.

It was used in the amplification and cloning of the human arginase II gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human arginase II protein – useful for treating, e.g. diseases associated with defect in arginase II gene such as episodic

Novel human arginase II polypeptides useful for treating urea cycle diseases, hypertension, hypotension, episodic hyperammonemia, to control nitric oxide formation and kidney damage -

Example 1; Fig 3; 37pp; English

The present invention describes human arginase II. Arginase II has
hypotensive, hypertensive, uropathic, cytostatic and neuroprotective
activities, and can be used in gene therapy and as a nitric oxide
biosynthesis modulator. Human arginase II proteins can be used to treat
diseases associated with or caused by a defect in the arginase II gene
or arginase II gene expression, such as, for e.g. urea cycle diseases,
hypertension, hypotension, episodic hyperammonaemia, defects in
biosynthesis of proline, quitamete, nitric oxide and ornithine, as well
as hyperargininaemia and its related spasticity, growth retardation,
and progressive mental impairment, and prostatic disease, particularly
prostate cancer, prostatic damage, kidney disease and kidney
constate cancer, prostate damage, kidney disease and kidney
damage. It is also used to control nitric oxide formation in an
individual Arginase II or its fragments, variants or derivatives can be
used as diagnostic reagents for diagnosing arginase II deficiency in an
individual having or suspected of having a defect in the nitric oxide pathway and the urea cycle. The genes encoding arginase II are used in gene therapy techniques to treat the above mentioned disorders. It is also used to deplete systemic arginine levels in an individual. AAA08061 to AAA08073 represent PCR primers used in the cloning of human arginase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD42 (qil4732114 |qib|AFL29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the linsert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ŏλ
                                                                                          (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (qil4732114 qplAR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 (bases 1 to 49)

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ţ

electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qil4732114)gb/RF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymorleoctide kinase. Adaptor oligonucleoctides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to

Another—"Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL19W, testis NHT, and B-cell NCI_CGAP_GCBI) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Spares and M. Fatima Bonaldo. "
10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil/4732114/gb)A21.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

| | | | Trypanosoma brucei (TRE09274 GUTat 10.1) was mechanically sheared to give a tight size distribution (4 kb). The v + i method used for the library construction is | described in detail in Smith, H. and Vener, J.C. (Marking Small insert libraries for whole genome Shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. | Barrell, Oxford University Press, 1999). /note="Vector: PWD42nv; Purified genomic DNA from M.
musculus G57BL/60 (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynuclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gal
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil4732114|gb|AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mus musculus

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114) plant29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mus musculus subtractors, Craniata; Vertebrata; Euteleostomi; Butaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Mus. 1 (bases 1 to 37)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 δλ
                                                        (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114)pblARI29072.1), a copyrnumber inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10.Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                             (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qi|4732114 qiplaH23072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the linsert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qil4732114) (pblAR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for amploillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DENGATYOCA: Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Primates; Catarrhin; Hominidae; Homo. 1 (bases 1 to 46).

double-stranded cDNA was ligated to a DraIII adaptor [CTGTCGCTARCTG5], digsted and cloned into distinct DraIII sites of the pME185-FL3 vector [5' site CACTGTGTG, 3' site CACCATGTG). XhoI should be used to isolate the cDNA insert. Size selection was performed to exclude fragments cl.5kb. Library constructed by Dr. Sumio Sugano (University of Tokyo Institute of Medical Science). CUTCTGCTCTRAAAGCTGCG and 3' end primer CTGCTGCAGCACACA."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt endrrepaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus. 1 (bases 1 to 29)

                                                                                                                                                ŏ
                                                                                                                                                                                         g
ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel. electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chanically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CDNA Library Preparation: Life Technologies, Inc.
